What is an open hay shed?

Open hay sheds are a popular choice for farmers looking for cost-effective storage options. Hay storage structures provide adequate airflow, reducing the risk of moisture buildup and mold formation. Open hay sheds typically consist of a roof and supporting poles, allowing for easy access and loading of bales.

What are the different types of hay storage buildings?

In addition to open hay sheds and enclosed hay barns, other types of hay storage buildings offer unique benefits and features. Open hay sheds are a popular choice for farmers looking for cost-effective storage options. Hay storage structures provide adequate airflow, reducing the risk of moisture buildup and mold formation.

How do you choose a hay storage building?

Hay storage buildings are typically constructed using materials such as steel, wood, or fabric. Evaluate the durability and longevity of the materials used, as they will directly impact the lifespan of the building. Consider factors such as resistance to corrosion, pests, and structural integrity when choosing a material that suits your needs.

Can you put Hay in a shed before putting on a roof?

Before putting on the roof, a few loads of hay can be put in the shed after the back wall is built, to give something to stand on while starting to make the roof. Long poles (six to eight-inch diameter) can be used to make the roof trusses, building them on the ground.

Should farmers use Open hay sheds or enclosed hay barns?

Farmers often use open hay sheds for storing hay that will be used soon, as they provide easy access for regular retrieval of bales. For farmers who prioritize maximum protection for their hay, enclosed hay barns are an ideal option. These structures provide complete protection from the elements, including rain, snow, and sunlight.

Should you tarp a hay shed?

In wet years a fair amount of hay can be ruined in spite of good tarps. A good hay shed can be paid for in just a few years by preventing the hay losses that occur with tarping a stack, and eliminating the risk of feeding damaged hay. Hay that gets wet from rain or melting snow can mold.
