

Will Electric based heating drive the transition in Bolivia?

Heating demand in Bolivia transitions from a system dominated by natural gas and biomass to a largely electrified heating sector. Because of the low cost of renewable electricity, electric based heating will drive the transition for Bolivia's heat sector. Fig. 13.

Does Bolivia have a long-term energy plan?

As previously mentioned, the Bolivian government does not provide any long-term energy planning study, however, the UNFCCC (2015b) states that RE will compose 81% of electricity generation by 2030. Bolivia's scenario for 2027 according to MHE (2009) states that biomass sources will comprise 8% of total final energy demand.

Should Bolivia use solar energy to generate synthetic fuels?

Using Bolivia's own excellent solar resources to generate synthetic fuels in BPS-1 and BPS-2 would result in energy independence and security. Due to the lack of GHG emission costs in BPS-3 fuel costs remain for the fossil fuels used in the heat and transport sectors. Fig. 23.

Can solar PV reduce energy poverty in Bolivia?

These efficiency savings can be estimated to about 22%, 14%, and 26% for BPS-1, BPS-2, and BPS-3, respectively. Furthermore, large-scale development of solar PV, particularly in off-grid communities, can serve to reduce energy poverty in Bolivia (Sovacool, 2012).

How can a fuel consumption model be used in Bolivia?

At the structural level, the model allows to simulate scenarios with aggregated changes in fuel consumptions for the more relevant sectors in Bolivia. However, the proper representation of activities/services, technologies used and their energy requirements at end-user level is limited.

Does Bolivia have a lithium resource?

Given that Bolivia's PT region is home to the largest lithium reserve in the world (Sauer et al., 2015), development of cost of Bolivia's own lithium usage as extraction of this resource develops may influence decision makers regarding lithium applications in the Bolivian energy system.

The values of energy storage density and energy storage efficiency is 0.91 J/cm^3 and 79.51%, respectively for the $0.90\text{LLBNTZ}-0.10\text{NBN}$ ceramic at 100 kV/cm and $90 \text{ }^\circ\text{C}$. It can be concluded that the $(1-x)\text{LLBNTZ}-x\text{NBN}$ ceramics are promising lead-free candidate materials for energy storage devices over a broad temperature range [53].
