What are energy storage and return (ESAR) prosthetic feet?

1. Introduction Energy storage and return (ESAR) prosthetic feet are designed to emulate the compliant structures of the anatomical lower-limb via a spring-like construction of carbon fiber .

Can Fe optimization improve the performance of ESR prosthetic feet?

To address these limitations, it can be seen that the application of optimization combined with FE method improves the results [17,18]. This study introduces a multi-objective optimization framework for ESR prosthetic feet made from low-cost aluminum alloy.

Why do ESAR prostheses lose energy when dynamically loaded?

Since the prostheses possessed similar viscoelasticity, were loaded under the same conditions, and their major differentiating feature was their geometry, it then follows that the biggest contributing factor to energy lost by an ESAR prosthesis when dynamically loaded is its shape and thickness.
