

How to divide the energy storage profit

How do I evaluate potential revenue streams from energy storage assets?

Evaluating potential revenue streams from flexible assets, such as energy storage systems, is not simple. Investors need to consider the various value pools available to a storage asset, including wholesale, grid services, and capacity markets, as well as the inherent volatility of the prices of each (see sidebar, "Glossary").

How a shared energy storage system works?

A two-stage model describing the storage sharing among stakeholders is developed. Storage sharing contribution rate is defined to inspire stakeholders to join share. An incentive mechanism is designed based on the asymmetric Nash bargaining model. Shared energy storage system ensures the economic feasibility of all participants.

Do investors underestimate the value of energy storage?

While energy storage is already being deployed to support grids across major power markets, new McKinsey analysis suggests investors often underestimate the value of energy storage in their business cases.

How to calculate rate of return on energy storage investment?

The rate of return on energy storage investment is reflected by the ratio of annual investment profit to aggregate investment, which can be expressed as : (3.56) $ROI = \frac{PAI}{C_{inv}}$ where ROI is the rate of return on storage investment, PAI is annual investment profit of the energy storage system.

How to calculate net present value of energy storage system?

Net present value can reflect the economic performance of investment in storage system, which can be calculated as follows : (3.54) $NPV = \sum_{t=1}^T \frac{CF_t}{1+r^t} - C_{inv}$ where $CF(t)$ is the cash flow in year t , C_{inv} is the total investment cost of the energy storage system, T is the lifetime of energy storage system.

How to coordinate energy sharing strategies?

The auction-based model is another promising method to coordinate energy sharing strategies . For example, a periodically organized auction mechanism is designed to share storage resources by assigning physical storage rights to multiple participants .
