How does a solar PV-T collector work?

Solar PV-T collectors Most of the solar radiation absorbed by a PV cell is converted to heat (in fact, internal energy), increasing the temperature of the cell and decreasing its electrical efficiency [35, , ,].

How much solar energy is transmitted through a PV-T collector?

Their experimental results show that 53% of the solar energy incident on the PV-T collector was transmitted through the PV cells, 18% was dissipated as waste heat in the PV cells, 4% was converted to electricity by the PV cells, and 23% was lost to reflection.
