

What is phase change thermal energy storage?

Phase change thermal energy storage technology utilizes phase change materials (PCMs) to store energy by absorbing or releasing a large amount of latent heat during the phase transition process. As shown in Fig. 4, the phase change process typically includes solid-solid phase change, solid-liquid phase change, and gas-liquid phase change.

Can phase change materials and spiral tube heat exchangers improve storage performance?

Incorporating Phase Change Materials (PCMs) and spiral tube heat exchangers into metal hydride reactors improves storage performance significantly. The present paper includes a numerical investigation on the storage performance of a novel Porous Metal Hydride Tank (PMHT) integrated with PCM as a passive heat transfer system.

How is energy transported inside a phase change material based thermal energy storage system?

The energy transport inside a phase change material (PCM) based thermal energy storage system using metal foams as an enhancement technique is investigated numerically. The paraffin is used as the PCM and water as the heat transfer fluid (HTF).

Why is enhanced heat transfer important in phase change thermal storage devices?

However, there are also issues such as the small thermal conductivity of phase change materials (PCMs) and poor efficiency in heat storage and release, and in recent years, enhanced heat transfer in phase change thermal storage devices has become one of the research hotspots for optimizing thermal storage devices.
