

Shock absorber energy storage principle

How regenerative shock absorber works?

The vibration energy is harvested and converted to electricity which is used to dissipate as heat in suspension system. The regenerative shock absorber consists of four parts: suspension vibration input module, transmission mechanism module, generator module and power storage module.

How does a hydraulic shock absorber work?

The conventional hydraulic shock absorber is responsible for absorbing vibration energy caused by uneven road excitations and maintaining the vehicle's comfort and handling. Simultaneously, the vibration energy is wasted in the form of heat to the environment. RSA may transform vibration energy into electrical energy for later use.

Do shock absorbers save energy?

Several studies reported that conventional shock absorbers are liable for 30% of energy dissipated at wheel systems, which is approximately 10% of the total vehicle fuel consumption (Abdelkareem et al. 2019). The RSA can recover waste vibration energy from the suspension system while reducing the vibrations (Cai and Zhu 2022).

How efficient is shock absorber energy harvesting?

At the same time, the proposed shock absorber energy harvesting efficiency at 1 Hz is 40.2 to 48.5%. Also, Waleed et al. reported 30% energy harvesting efficiency at 5 mm and 1 Hz, less than the proposed system. Abdelkareem et al. analyzed the harvestable potential power of different vehicles.

Can shock absorbers be used for energy harvesting and vehicle dynamics?

In the literature, researchers performed analyses of energy harvesting and vehicle dynamics by replacing conventional shock absorbers with RSA. The RSA can be installed for energy regeneration in all on-road vehicles; however, the amount of energy harvested depends on road conditions and vehicles.

How much energy does a suspension shock absorber dissipate?

In 1987, Wambold et al. analysed the energy dissipation problem of suspension shock absorber when the vehicle is running on the road. The results show that the energy dissipated by each suspension shock absorber is approximately 40-60 W.
