

Swedish energy storage hydraulic station design

How does hydropower work in Sweden?

In Sweden, hydropower is a major source of the RE in the energy system, in which the reservoir type power plant can regulate the production based on the fluctuations in the demand. It constitutes around 40% of the total electricity supplied over the years .

How much power does a Swedish hydropower plant produce?

For the sake of comparison, it can be noted that at present Swedish hydropower plants are characterized by (i) 35-180 m of head, (ii) 220-980 MW of power output and (iii) 500-2300 GWh/year of produced electric energy .

Can energy storage be used in hydropower plants?

The addition of energy storage in hydropower plants can help overcome the upcoming flow regulations in rivers. In addition to this, the incorporation of an energy storage specifically in a hydropower plant can have the advantage of minimizing grid losses and transmission losses.

How can a gravity hydraulic energy storage system be improved?

For a gravity hydraulic energy storage system, the energy storage density is low and can be improved using CAES technology. As shown in Fig. 25, Berrada et al. introduced CAES equipment into a gravity hydraulic energy storage system and proposed a GCAHPTS system.

What is hydraulic compressed air energy storage technology?

Hence, hydraulic compressed air energy storage technology has been proposed, which combines the advantages of pumped storage and compressed air energy storage technologies. This technology offers promising applications and thus has garnered considerable attention in the energy storage field.

What is pumped hydro storage (PHS)?

Pumped hydro storage (PHS) is the largest and most mature technology suitable to store energy. As non-predictable renewable energy penetration increases, PHS is expected to become more and more widespread. Pumped hydro plants are characterized by a round-trip efficiency ranging from 70 % to 80 % .
