

The advantages of building a large-scale battery energy storage power station

Can large-scale battery energy storage technology be used in energy storage systems?

In addition, the paper introduces the current application of large-scale battery energy storage technology and several key technologies in battery energy storage systems, carries out preliminary analysis on the development of energy storage standard systems, and analyzes the future outlook for the development of battery energy storage technology.

Why is battery energy storage important?

In order to reduce the impact on the safe operation of power grid, battery energy storage can be used as key technology to stabilize power output and provide backup power. This can also help adjust electricity prices and optimize the allocation of electricity resources on the market.

Are advanced batteries suitable for large-scale energy storage?

Researchers have made great efforts to develop advanced batteries for a better performance and a wider range of applications. Although battery has been studied decades and been mature in practical application, it is still not the most suitable large-scale energy storage. Table 2.

Are battery energy-storage technologies necessary for grid-scale energy storage?

The rise in renewable energy utilization is increasing demand for battery energy-storage technologies (BESTs). BESTs based on lithium-ion batteries are being developed and deployed. However, this technology alone does not meet all the requirements for grid-scale energy storage.

What is a battery energy storage station?

Battery energy storage station, by virtue of their swift response, can quickly absorb or release electricity to achieve complete power balance in emergent situations. When power failure occurs due to system breakdown, battery energy storage station can transmit power to the key load of the local grid, to prevent losses due to power outage.

Why do we need energy storage stations?

Besides, the energy storage station could serve as allocable resources for power grid to provide auxiliary services to large power grid in combination with renewable energy, in order to cope with transient stability and the demand of short-time power balance of power grid, or issues such as blockage in transmission and distribution lines.
