The SVG utilises a high speed three level inverter that reacts to changes in reactive power, exchanging corrective reactive power into the system. Full correction is made in 3/4 of a cycle. This rapid response provides stable accurate real-time power factor correction without the drawbacks of traditional capacitor based systems.

The power factor is the ratio of real power (kW) to apparent power (kVA) and is an important parameter in AC power systems. PFC components refer to the various electronic components used in power factor correction circuits. These components are designed to correct or improve the power factor and ensure efficient power transmission and utilization.
