Can large-scale electricity storage be used in Great Britain?

This report considers the use of large-scale electricity storage when power is supplied predominantly by wind and solar. It draws on studies from around the world but is focussed on the need for large-scale electrical energy storage in Great Britain (GB) and how, and at what cost, storage needs might best be met.

Are there high-voltage transmission links in the UK?

The following is a list of high-voltage transmission links in the United Kingdom, including some under construction or proposed. The main direction of interconnector flows is into the UK electricity market.

Does the UK have a power grid?

The UK grid has access to large pumped storage systems, notably Dinorwig Power Station which can provide 1.7 GW for 5-6 hours, and the smaller Cruachan and Ffestiniog. There are also some grid batteries.

When will long duration electricity storage (LDES) become a cap & floor revenue stabilisation mechanism?

There has been a shift in the pipeline for current and future long duration electricity storage (LDES), from over 7.2GW in December 2023 to 10.5GW in May 2024. In January, the Government published its long-awaited consultation on the cap and floor revenue stabilisation mechanism for LDES.

How will pylons & cables affect UK electricity bills?

Ofgem expects the investments will lead to an estimated  $\pounds 104$  annual increase to charges on household bills. The investments would fund the "biggest expansion of the electricity grid since the 1960s", said Ofgem, as pylons and cables are rolled out to help cater for growing levels of wind and solar power, as part of Britain's clean power push.

How much electricity do interconnectors provide to the UK?

During 2021, interconnectors provided 28 TWh of electricity to the UK, which equates to 10% of total demand, whilst in 2009 this figure was 7 TWh. Interconnectors allow the trade of electricity between countries with excess generation (for example, intermittent renewable) and those with high demand.
