

Welding thickness requirements for energy storage welding machines

How much amperage do you need to weld?

The amperage needed to weld depends on electrode diameter, the size and thickness of the pieces to be welded, and the position of the welding. Thin metals require less current than thick metals, and a small electrode requires less amperage than a large one. It is preferable to weld on work in the flat or horizontal position.

What plate thickness should a test weld be welded to?

Each test welded of thickness t shall qualify for plate thicknesses from $2t$ down to $t/2$, but not less than $5/8$ in. For plate thicknesses less than $5/8$ in., a test weld shall be made for the thinnest shell plate to be welded; this test weld will qualify the plate thickness from t up to $2t$.

How thick should a fillet weld be?

The fillet weld size shall be at least 0.25 times the thickness of the nozzle wall, not including corrosion allowance, except that for relatively thick nozzle walls, the fillet weld shall be not less than 0.25 times the thickness of standard-weight or extra-strong pipe, whichever is nearest to and less than the nozzle wall thickness.

How thick should a tank be after welding?

Tank sections that have a nominal thickness of wall plate greater than $1 1/4$ in. at any nozzle penetration greater than $21\ 12$ " NPS shall be thermally stress relieved after welding. For P-1 materials, the $1 1/4$ in. thickness may be increased to $21\ 11/2$ in., provided that a minimum preheat temperature of $200\ \&\#176;F$ is maintained during welding.

What are the parameters for intermediate thicknesses?

For intermediate thicknesses parameters may be interpolated. Metal thicknesses represent the actual thickness of the sheets being welded. In the case of welding two sheets of different thicknesses, use the welding parameters for the thinner sheet.

What are metal thicknesses?

Metal thicknesses represent the actual thickness of the sheets being welded. In the case of welding two sheets of different thicknesses, use the welding parameters for the thinner sheet. Welding parameters are applicable when using electrode materials included in RWMA Classes 1, 2, and 20.
