What is shared energy storage?

Shared energy storage involves multiple agents, objectives, and constraints. Its configuration and operation require careful coordination and decision-making, with attention to market dynamics, contract structuring, and revenue sharing .

How can shared energy storage services be optimized?

A multi-agent model for distributed shared energy storage services is proposed. A tri-level model is designed for optimizing shared energy storage allocation. A hybrid solution combining analytical and heuristic methods is developed. A comparative analysis reveals shared energy storage's features and advantages.

Is shared energy storage a viable alternative to conventional energy storage?

A comparative analysis reveals shared energy storage's features and advantages. Shared energy storage has the potential to decrease the expenditure and operational costs of conventional energy storage devices.

What factors affect shared energy storage?

The model considers the concerns of stakeholders in shared energy storage, including investors, users, and power grid operators. Additionally, the impact of intricate factors, such as actual distribution network topology and power flow, is taken into consideration.

Should energy storage devices be shared among multiple agents?

In summary, configuring and sharing an energy storage device among multiple agents, in consideration of their respective interests, can lead to more efficient utilization of the device. Moreover, such a setup can determine the most suitable configuration and operation mode under the influence of various factors.

How to create a shared energy storage community?

Community setup The first step to have shared energy storage is to form communities which are built by using the k -means approach. The geographical locations (longitude and latitude) are used to cluster the households. In this case,  $K = 3$  is used to form three communities due to the distance limitation of CES and the road intersection.
